

ABSTRACT OF THE DISCLOSURE

A container system which comprises at least one flexible resilient clamp device detachably fixable to a container. The clamp device comprises at least two substantially opposite clamp halves which are at least interconnected at a top part of the clamp device, are adapted to be moved towards each other, and which exert an outward pressure when compressed. The clamp device further comprises in at least one fixation structure adapted to hold the clamp device in a fixed position. The container comprises a bottom plate, at least two substantially parallel side walls, and at least one complementary fixation structure on each opposing side wall for engaging the clamp device fixation structure.
